

## The BTR – Spiral Bridge, in fact Twin Bridges

The Girders & Corbels are Hardwood, well oiled with wood preservative.

The Spiral track is seen passing under the bridge from the cutting .

Spiral Bridge, originally built as a single track, the Inner track [at top of photo] is the Summit of the Spiral. The Outer track [at bottom of photo] added at one time as the BTR track plan evolved.

This CROSSOVER installed later created a Junction “on the bridge”. The lower right track and the left hand turnout point have since been removed to further rationalize train movements.

The present arrangement shows the right hand turnout points partially “on the bridge”.
